HANDLING, STORAGE, AND PROTECTION OF ALUMINUM

The following precautions are recommended to protect the material against damage. Following these precautions will help ensure early acceptance of your products and workmanship.

A. HANDLE CAREFULLY.
   All aluminum materials at the job site must be stored in a safe place, well removed from possible damage by other trades. Cardboard wrapped or paper interleaved materials must be kept dry.

B. CHECK ARRIVING MATERIALS.
   Check for quantity counts and keep records of where various materials are stored.

C. KEEP MATERIALS AWAY FROM WATER, MUD, AND SPRAY.
   Prevent cement, plaster, or other materials from damaging the finish.

D. PROTECT THE MATERIALS AFTER ERECTION.
   Protect erected frame with polyethylene or canvas splatter screen. Cement, plaster, terrazzo, other alkaline solutions, and acid based materials used to clean masonry are harmful to the finish. **If any of these materials come in contact with the aluminum, immediately remove with water and mild soap.**

The rapidly changing technology within the architectural aluminum products industry demands that U.S. Aluminum reserve the right to revise, discontinue or change any product line, specification or electronic media without prior written notice.

NOTE: Dimensions in parentheses ( ) are millimeters unless otherwise noted.
GENERAL INSTALLATION NOTES
Recommended guidelines for all installations:

1. REVIEW CONTRACT DOCUMENTS. Check shop drawings, installation instructions, architectural drawings, and shipping lists to become thoroughly familiar with the project. The shop drawings take precedence and include specific details for the project. Note any field verified notes on the shop drawings prior to installing. The installation instructions are of a general nature and cover most conditions.

2. INSTALLATION. All materials are to be installed plumb, level, square, and true.

3. BENCH MARKS. All work should start from bench marks and/or column lines as established by the architectural drawings and the general contractor with guaranteed accuracy. Working from these datum points and lines determine:
   a) The plane of the wall in reference to offset lines provided on each floor.
   b) The finish floor lines in reference to bench marks on the outer building columns.
   c) Mullion spacing from both ends of masonry opening to prevent dimensional build-up of daylight opening.

4. STEEL ANCHORS. Steel anchors that weld to steel structure are normally line set before mullions are hung. Outstanding leg of anchors must be at 90 degrees to offset lines. Mullion space should be held to ±1/32" (0.8). Anchor clips vary per job conditions. Follow approved shop drawings for size and location of clips.

5. FIELD WELDING. All field welding must be adequately shielded to avoid any splatter on glass or aluminum. Results will be unsightly and/or structurally unsound. Advise general contractor and other trades accordingly. All field welds of steel anchors must receive touch-up paint (zinc chromate) to avoid rust.

6. SURROUNDING CONDITIONS. Make certain that construction which will receive your materials is in accordance with the contract documents. If not, notify the general contractor in writing and resolve differences before proceeding with work.

7. ISOLATION OF ALUMINUM. Aluminum to be placed in direct contact with uncured masonry or incompatible materials should be isolated with a heavy coat of zinc chromate or bituminous paint.

8. SEALANTS. Sealants must be compatible with all materials with which they have contact, including other sealant surfaces. Consult with sealant manufacturer for recommendations relative to joint size, shelf life, compatibility, cleaning, priming, tooling, adhesion, etc. It is the responsibility of the Glazing Contractor to submit a statement from the sealant manufacturer indicating that glass and glazing materials have been tested for compatibility and adhesion with glazing sealants, and interpreting test results relative to material performance, including recommendations for primers and substrate preparation required to obtain adhesion. The chemical compatibility of all glazing materials and framing sealants with each other and with like materials used in glass fabrication must be established. This is required on every project.

9. FASTENING. Within the body of these instructions "fastening" means any method of securing one part to another or to adjacent materials. Only those fasteners used within the system are specified in these instructions. Due to the varying perimeter conditions and performance requirements, perimeter and anchor fasteners are not specified in these instructions. For perimeter and anchor fasteners refer to the shop drawings or consult the fastener supplier.

10. BUILDING CODES. Due to the diversity in state/provincial, local, and federal laws and codes that govern the design and application of architectural products, it is the responsibility of the individual architect, owner, and installer to assure that products selected for use on projects comply with all the applicable building codes and laws. U.S. Aluminum exercises no control over the use or application of its products, glazing materials, and operating hardware, and assumes no responsibility thereof.

11. EXPANSION JOINTS. Expansion joints and perimeter seals shown in these instructions and in the shop drawings are shown at normal size. Actual dimensions may vary due to perimeter conditions and/or difference in metal temperature between the time of fabrication and the time of installation. Gaps between expansion members should be based on temperature at time of installation.

12. WATER HOSE TEST. As soon as representative amount of the wall has been glazed (500 square feet or 46.5 m²) a water hose test should be conducted in accordance with AAMA 501.2 specifications to check the installation. On all jobs the hose test should be repeated every 500 square feet (46.5 m²) during the glazing operation.

13. COORDINATION WITH OTHER TRADES. Coordinate with the general contractor any sequence with other trades which offset curtain wall installation (i.e. fire proofing, back-up walls, partitions, ceilings, mechanical ducts, converters, etc.).

14. CARE AND MAINTENANCE. Final cleaning of exposed aluminum surfaces should be done in accordance with AAMA 609.1 for anodized aluminum and 610.1 for painted aluminum.

15. JOB SITE ESSENTIALS. See pages 45 and 46.

JOB SITE ESSENTIALS .......................................................................................................................... 45, 46
1. Review and measure the opening.

2. Verify rough window opening size 1/2" (12.7) clearance in both width and height to the window. Verify framing is plumb, straight, and true around window opening. Measure opening at each end and at center vertically and horizontally. Make corrections to openings as required. Measure opening diagonally to check squareness. Chip concrete high points to flush and rounded corners to square.

FRAME FABRICATION (CONTINUED)

DRILLING

NOTE: See pages 40-42 for optional Horizontal Load Bearing Brackets

2. Mark on verticals the location of horizontal members and drill holes for shear blocks. Drill Jigs are available. See DETAIL B for drill guide usage.

3. Fabricate ends of horizontal members for shear block pick-up screws. See DETAIL C for drill guide usage.

NOTE: Triple glaze assemblies may require optional Horizontal load bearing brackets. Visit: usalum.com for more information.

Dimension A

A = 2-1/8"(82.6) @ 5" Back Member

Not to Scale
4. Some open back Head and Sill Members require notching at each end for shear block clearance as shown in DETAIL D.

5. Fabricate bottom of horizontal face covers for weep holes 6" from each end as shown in DETAIL E.

NOTE: See pages 40-42 for optional Load Bearing Brackets
6. Vertical pressure bars feature 9/32" (7.1) dia. attachment holes 9" (228.6) On Center; additional holes should be drilled at 1-1/2" (38.1) from all ends and at vertical/horizontal intersections.

7. Fabricate two 1/4" x 1-1/2" (6.4 x 38.1) weep slots 4" (101.6) from each end in horizontal pressure bars and drill 9/32" (7.1) dia. attachment holes 1-1/2" (38.1) from each end as shown on DETAIL F.
NOTE: ANCHOR TYPE AND SIZES VARY PER JOB REQUIREMENTS. DETAILS SHOWN ARE TO BE USED AS A GUIDE ONLY. SEE APPROVED SHOP DRAWINGS FOR ACTUAL CONDITIONS.

SINGLE SPAN CONDITION

1. Slide top and bottom "T" anchors into vertical members. See DETAIL G.

2. Install verticals plumb and level. If shims are required place them directly under each vertical for proper load distribution. Secure top and bottom anchors to structure.

DETAIL G

"T" Anchors at Wall Jamb Condition (Two Bolts Minimum) Typical at Top and Bottom

Shim Both Sides

Field Prepare per Job Conditions and Loading, Two Bolts at each Anchor Minimum.

Top and Bottom "T" Anchors

Aluminum anchors must be isolated from dissimilar materials. Typical at top and bottom.

Closer Plates Shown for Reference. See DETAIL N for Closer Plate Installation.
3. Attach shear blocks to verticals with screws provided. **See DETAIL H** for shear blocks position. **NOTE:** Use tubular horizontals when span exceeds 6'-0" (1.8 m) or deadload exceeds 250 lbs. (113.4 Kg) use optional load bearing bracket and proper horizontal mullion when glazing unit exceeds deadload chart. (See page 40)
SINGLE SPAN CONDITION (continued)

**NOTE:** Elevations using tubular horizontals must be installed per bay. See DETAIL H for head and sill conditions.

---

**DETAIL J**

- Notch Tubular Horizontal to Clear Shear Block. Head Condition Shown. (Sill Condition Reversed)
- 4 1/4 (117.5) notch at 5 (127) member
- Notch for Bolt Head Clearance Required per Size and Bolt Location. See Shop Drawings.
- PT924 Open Back Header (Sill Similar)
- PT904 Tubular Header (Sill Similar)
MULTI-SPAN CONDITION

Details K and L show fixed (deadload) and expansion (windload) anchors. Anchor type and size vary per job requirements. Details shown are to be used as a guide only. See approved shop drawings for actual conditions.

4. Secure verticals to anchor clips after alignment has been completed.

NOTE: Mullion spacing must be held to within +1/32” (0.8). Check overall frame dimension every four bays to monitor dimension build up.
5. Roll horizontal members over shear blocks and secure them with screws provided. See DETAIL M.

NOTE: See pages 40-42 for optional Load Bearing Brackets.
MULTI-SPAN CONDITION (continued)

TUBULAR HORIZONTALS
Install snap-in horizontal filler where open back of horizontal member is exposed.

NOTE: Snap-in fillers are optional at head and sill to facilitate interior caulking.
(Cut fillers short to clear shear blocks and snap them in before installing)

6. Slide horizontals over shear blocks and secure them with screws provided. See DETAIL N.

7. Apply RTV408 Silicone sealant to closer plates as shown in DETAIL O. Install at top and bottom of jambs and mullions after head and Sill Members are in place.

NOTE: It May Be Necessary to also attach Horizontal to Shear Block through Top or Bottom to Keep Tight Joint at Rear. See DETAIL N

NOTE: Clean All Surfaces prior to Applying Sealants. See Sealant Manufacturer Requirements.

TYPICAL AT ALL CONDITIONS
Position closer plate properly. Raised letters “EXTERIOR”
8. Once all verticals and perimeter members are installed, apply Cat. No. 95C/M64/M66 Sealant to seal around perimeter. Perimeter caulking must be completed prior to installation of glass and pressure bars. Insure perimeter sealant has smooth transition across vertical end dams.

9. Apply RTV408 Silicone Sealant to seal joint between horizontal and vertical. Also seal over heads of screws in the glazing pockets with Cat. No. 33S Silicone.

10. Apply RTV408 Silicone Sealant at the three contact areas of end dams. Also fill the vertical gasket reglet with RTV408 Silicone Sealant at the end dam location. See DETAIL P. Slide end dams into place.

NOTE: End dams occur at head and sill also.
GLAZING

GLASS SIZES

GLASS WIDTH & HEIGHT = DAYLIGHT OPENING + 1" (25.4)

NOTE: These formulae do not take into account glass tolerances. Consult glass manufacturer before ordering glass.

Remove gaskets from carton and lay flat in a clean, dry area in order to recover shape. Allow gaskets to relax at least two hours at temperatures above 50°F (10°C). Glaze with gaskets above 40°F (4.4°C). If necessary warm gaskets in a hot box prior to installing.

Use **NP430** dense gasket at exterior and **NP420** sponge at interior.

1. Cut gaskets allowing 1/8" (3.2) extra length per foot of extrusion to allow for shrinkage.
   Vertical gaskets on mullion run past horizontal gaskets by 5/8" (15.9). See DETAIL R
   Horizontal gaskets butt against vertical gaskets.

2. Install back gaskets into vertical and horizontal members and front gaskets into pressure bars.
   Horizontal pressure bar gaskets should extend 1/8" (3.2) beyond each end of the extrusions.
   Vertical pressure bar gaskets run continuous.

3. Position two setting blocks for each glass lite as directed by the deadload charts and shop drawings.

4. Peel off side blocks paper backing and locate them, two per glass lite, at approximately mid-height of glass. See DETAIL R.

---

**DETAIL R**

NOT TO SCALE
5. Apply bead of sealant at interior gaskets' corners 2" (50.8) in each direction. See DETAIL T.

6. Install glass and center in opening. Use CW368 temporary glass retainers to hold glass in place until pressure bars are installed. See DETAIL S.

7. Apply sealant to face of dams. This is a critical seal area. See DETAIL T.

**NOTE:**
Vertical Gaskets do not run through to allow for End Dam installation. They extend approximately 5/8" (16) past the edge of the Horizontal.
STRUCTURAL SILICONE GLAZING
VERTICAL MULLIONS

Series HP3253SG  Triple glaze is shown below, Series 3252SG dual glaze is similar.

GLASS WIDTH & HEIGHT = DAYLIGHT OPENING + 1" (25.4)

NOTE: These formulae do not take into account glass tolerances.
Consult glass manufacturer before ordering glass.
Refer to item 8 of the General Installation Notes on page 03 regarding structural sealants.

Remove gaskets from carton and lay flat in a clean, dry area in order to recover shape. Allow gaskets to relax at least two hours at temperatures above 50°F (10°C). Glaze with gaskets above 40°F (4.4°C). If necessary warm gaskets in a hot box prior to installing.

For the intermediate horizontal mullions, use NP430 dense gasket at the exterior and NP420 sponge gasket for the interior. Use SP450 spacer gasket on the Intermediate Vertical Mullions.

1. Cut gaskets 1/8" (3.2) long per foot of extrusion to allow for shrinkage.
Vertical gaskets on mullion run past horizontal gaskets by 5/8" (15.9). See DETAIL W.
Horizontal gaskets butt against vertical gaskets.
Insert a water deflector between the two horizontal members and install spacer gaskets into verticals.
See DETAIL U.
2. Install the NP420 back gaskets into the intermediate horizontal mullions. See DETAIL V. Seal the horizontal gaskets to the vertical gaskets and the joints around all water deflectors with RTV408 Silicone Sealant as shown in DETAIL W.

3. Position the two setting blocks on the horizontal mullions for each glass lite as directed by the deadload charts and shop drawings. See DETAIL W.

4. Remove paper backing from the side blocks and apply to the Jambs only, at approximately mid-height of glass. See DETAIL R on page 17. Install front gaskets, NP430, into horizontal pressure bars. The pressure bar gaskets should extend 1/8" (3.2) beyond each end of the extrusion.
5. Install the glass unit and center it in the opening and on top of the two setting blocks. See DETAIL X. Openings with Jamb members should have the glass units flush with the side blocks.

6. Partially secure the glass units in place by installing the Horizontal Pressure Bar to the horizontal mullions with screws, CAT. NO. MS222. Weep slots should be to the top of the bar when installed. See DETAIL Y.
7. At the Intermediate Verticals, install RG720 temporary glass retainers. (See DETAIL AA for number of clips per mullion). Insert the long end of the retainer in between the glass units and turn clockwise to engage with the mullion. See DETAIL Z.
8. Securing the glass from the exterior with the horizontal pressure bars and temporary retainers. See DETAIL BB. Apply structural silicone to the intermediate vertical mullions on the interior side.

The gap between the intermediate vertical mullion and the glass will be filled with structural silicone. Use masking tape along the edge of the mullion and on the glass to achieve a clean bead after tooling. See DETAIL CC. Remove the masking tape before the silicone cures.

NOTE: Always follow structural silicone manufacturer’s instructions and recommendations for surface preparation and silicone application.

9. Following the manufacturer’s specifications, allow the silicone to fully cure before removing the temporary glass retainers. After removing the glass retainers, insert open cell polyurethane backer rod between the glass edges on the exterior side. Mask glass and aluminum adjacent to joint and apply CRL RTV408 sealant for an exterior weatherseal. See DETAIL DD.
10. Install the horizontal face cover onto the pressure bar, see DETAIL EE. Locate splice joints at center line of vertical glass butt joints. Splice joint width should be based on formula for linear expansion for aluminum specifications and sealant movement capability. **NOTE: Do not align face cover splices with pressure bar splices.** Offset 6" (152.4) minimum. See DETAIL FF. Set backer rod between face cover and pressure bar at joint and seal.

![Diagram of DETAIL EE and DETAIL FF]

**HORIZONTAL FACE COVER SPLICE JOINTS**

- Tool sealant over backer rod
- Weatherseal
- Weep slot
- Apply bond breaker tape to face of splice sleeve and seal over splice joint with Cat. No. 95C Silicone
- 6" (152.4) Minimum offset

**DETAIL EE**

**DETAIL FF**
Install vertical pressure bar bolts from bottom to top and horizontal pressure bar bolts from center outward. Always locate bolts 1-1/2" (38.1) maximum from vertical/horizontal intersections to ensure proper pressure over end dams. See DETAIL S. Be sure pressure bar spacer is not disengaged.

1. Install vertical pressure bars first leaving 1/8" (3.2) gaps at top and bottom. Using a speed wrench, torque bolts to 30 inch pound (3.4N.m). Increase torque to 50 to 60 inch pound (5.7 to 6.8 N.m) minimum after all four sides have been secured.

2. Center horizontal pressure bars in opening leaving 1/8" (3.2) gaps at each end. NOTE: weep slots must be in top side of all horizontal pressure bars and level with bottom of glazing pocket to ensure proper drainage. See DETAIL T.

3. Seal gaps at vertical/horizontal intersections and at top and bottom of vertical pressure bars. See DETAIL U.
Care must be taken to prevent damage of face covers during installation. Use a piece of wood such as 2" x 4" x 12" (51 x 102 x 305) and a 3" (76.2) diameter Stanley 3 lbs. (13.3N) Compo-Cast dead blow soft face hammer.

4. Install vertical face covers first. Do not disturb top and bottom closure plates when installing face covers. Pinning of vertical face cover is required to prevent slippage. Use one pin on each side per cut length, concealed behind horizontal face cover closer to center line or as shown on shop drawings. See DETAIL U.

5. Install snap-in horizontal face covers with the weep holes located on the bottom side. Seal gaps at vertical/horizontal intersections and at top and bottom of vertical pressure bars. See page 8 DETAIL E.

**NOTE:** Extended face covers require a special pressure bar. Pin vertical extended covers with one 1/8" (3.2) dia. pop rivet on each side per cut length (optional #10 x 1/2" FH SMS) See DETAIL V. Extended horizontal covers must be pinned on top side at both ends.
1. Apply sealant into gasket reglets before installing snap-in transition adaptors.

2. Install vertical adaptors first.

3. Install horizontal adaptors and seal horizontal/vertical joints. Tool sealant. See DETAIL X.

PC921
From 1" to 1/4" Glass for Series 3252

PC321
From 2" to 1/4" Glass for Series 3253

NOTE: See Pages 40-42 for optional Load Barring Brackets

Fill Gap Between Adaptors and Main Members at All Sides of Opening with Continuous Bead of Sealant.

NOTE: See Pages 40-42 for optional Load Barring Brackets

Fill Gasket Reglet with Sealant before Installing Adaptors (This is a Continuous Seal)

Seal Horizontal/Vertical Joint and Tool Sealant.

D.L.O. +1" (25.4)

D.L.O. -1/8" (3.2)

D.L.O.
VERTICAL SPLICE JOINTS

Splice joint width should be based on sealant movement capability and on the following formula:

<table>
<thead>
<tr>
<th>Linear expansion for aluminum, in inches</th>
<th>Length ((\text{&quot;})) \times F° difference in temperature \times .0000129</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linear expansion for aluminum, in millimeters</td>
<td>Length (m) \times C° difference in temperature \times .02322</td>
</tr>
</tbody>
</table>

A 1/2" (12.7) minimum joint is recommended. Use a 1/2" (12.7) spacer shim to set and hold the mullion joint constant during erection. Remove the shim after attaching the verticals to the anchors. Splice joints must occur at spandrel areas.

1. Clean splice sleeves and all joint surfaces. Apply bond breaker tape at areas where sleeve will be sealed to avoid three side adhesion. See DETAIL Y.

2. Slide sleeve into the upper member before it is installed and tape to hold it in retracted position. See DETAIL Y.

3. Install stop screw, 2-3/4" (70) down from top of extrusion at inside of lower member. See DETAIL Z.

4. Install upper member and let extruded sleeve slide down until it sits on top of stop screw.

5. Seal joint over sleeve as shown in DETAIL AA. When transition adaptors for 1/4" (6) spandrel are used they should be discontinued at splice joint and installed after splice joint is sealed. Stagger joints on back members, pressure bars and face caps as shown in DETAIL Z.

6. Seal pressure bar joint. See DETAIL AA.

7. Install face covers and seal joint using backer rod as required. See DETAIL Z.

ENTRANCE FRAMES

Entrance Frames may be installed simultaneously with Curtain Wall or after Curtain Wall installation has been completed. Use PC952 or PC352 pocket fillers to close glazing pocket at door side.
1. Cut Door adapter members to length.

**CW907**
- Header adapter length = DOOR OPENING WIDTH minus 1/32" (.8)
- Jamb adapter length = DOOR OPENING HEIGHT plus 9/16" (14)

**CW906**
- Header cap length = DOOR OPENING WIDTH minus 1/32" (.8)
- Jamb cap length = DOOR OPENING HEIGHT plus 9/16" (14)

**CW209**
- Header door stop length = DOOR OPENING WIDTH minus 1/32" (.8)
- Jamb door stop length = DOOR OPENING HEIGHT plus 1-3/32" (27.8)

2. Drill 5/8" (7.9) diameter anchor holes in all cut to length adaptors 1-1/2" (38.1) from each end and 9" (228.6) O.C. See DETAIL DD.

**NOTE:** Isolator must be in place prior to drilling anchor holes.
3. Fabricate header adaptor for weep slots and additional anchor holes as shown in DETAIL EE.

4. For offset pivot doors, fabricate header adaptor for pivot (left hand shown), weep slots and additional anchor holes as shown in DETAIL FF. Notch face cap for pivot clearance as shown in DETAIL GG.
5. Fabricate for lock jamb see DETAIL HH. (Right hand shown left hand opposite)

6. Fabricate for butt hinges see DETAIL II. (Left hand shown right hand opposite)

7. For butt hung application, install hinge back up plates and threshold clips as shown in DETAIL KK and DETAIL LL. For offset pivot application, install bottom frame portion pivot(s) as shown in DETAIL MM. Single doors require threshold clip at lock jamb. See DETAIL LL.

8. Install gaskets in door adaptors.

These hardware items must be applied prior to door adaptor installation.
NOTE: PRIOR TO ADAPTOR INSTALLATION ALL END DAMS MUST BE INSTALLED AND SEALED. TRAN SOM AND SIDELIGHT GLASS MUST BE IN PLACE.

1. Seal face of end dams DETAIL S.

2. Install jamb door adaptors using MS22200 pressure bar bolts as shown in DETAIL NN. Vertical adaptors extend from floor to 9/16" above bottom of door header/horizontal. Install head door adaptor using MS22200 pressure bar bolts as shown in DETAIL NN.

3. Secure adaptors to mullion and head side walls with 20081601 self-drilling screws as shown in DETAIL NN.

4. Seal all pressure bar bolt heads. See DETAIL OO.

5. Seal gaps at intersections of pressure bars and door adaptors.
6. Install thresholds into opening using screws provided with door hardware. See DETAIL PP for butt hung and DETAIL QQ for offset pivot application.

7. Snap on face caps. See DETAIL RR. Vertical face caps run from floor to 9/16" above bottom of header. (Field cutting to length is recommended).

8. Snap door stop on header adaptor. See DETAIL RR. (Head door stop runs through)

9. Snap door stops on jamb members. See DETAIL RR.
10. For offset pivot doors, install frame portion pivots as shown. See DETAIL SS.

HORIZONTAL INSTALLATION (CONTINUED)

ATTACHING AND SEALING THE HORIZONTAL MEMBERS

1. Roll horizontal members over shear blocks and secure them with screws provided. See DETAIL B4.
2. Seal joint between horizontal and vertical. Also seal over head of screws in the glazing pockets.
3. Apply sealant at the three contact areas of end dams. Also fill the vertical gasket reglet with sealant at the end dam location. See DETAIL B5. Slide end dams into place. NOTE: End dams occur at head and sill also.
4. Using the Drill Jig DJ360, drill holes as illustrated below. See DETAIL B3

Secure Horizontal Members with (4) #12 X 3/4" Pan Head Fasteners on top and bottom.

Drill for Horizontal Load Brackets with .147" (#26) drill.
(6) total through holes top and bottom.

Drill Guide must be held tight against the Vertical Member Glazing Fin while drilling holes.

Drill for Horizontal Load Bracket with 5/16" Dia. drill. (3) through holes.

NOT TO SCALE

DETAIL B3

DETAIL B4

Top and Field Shear Blocks with relief facing down.

Top and Field Horizontal Members with openings facing upwards.

Bottom Sill Horizontal Members with openings facing down.

NOT TO SCALE
Please return to the Standard 3250 Installation Manual for the completion of the installation procedure.
NOTE: All sealants must be tooled to ensure proper adhesion.

**WATERPROOFING**

- **33S ACETIC CURE SILICONE**
  Sill to Subsill, End Dams, Screw Heads and Threshold to Door Frame Sealing.
  
  Seal Over Screw Heads CAT.NO. 33S
  
  Fill with Sealant to Create a Water Shed. CAT.NO. 33S
  
  NOTE: Not for use near insulated glass units with butyl sealant.

**JOINT ADHESIVE**

- **RTV408 NEUTRAL CURE SILICONE**
  Small Joints, End Joints and Buttered Surfaces, Water Diverter, End Dams and Reglet Fills.
  
  Fill screw riglet ends with CAT.NO. RTV408
  
  Butter Ends Before Assembly CAT. NO. RTV408
  
  Seal Vertical Gasket Reglet CAT. NO. RTV408
  
  Seal Screw Heads CAT. NO. RTV408
  
  Seal Water Diverter CAT. NO. RTV408
  
  NOTE: I.G. butyl contact OK.

**PERIMETER**

- **95C NEUTRAL CURE SILICONE**
  Expansion Joints.
  
  Bond Breaker Tape CAT.NO. 827T
  
  Seal Tape Edges CAT. NO. 95C
  
  Seal Gap CAT.NO. 95C
  
  Seal Screw Heads in Slotted (Expansion) Holes. CAT.NO. 95C
  
  Fill with Sealant to Create a Water Shed. CAT.NO. 33S/RTV408
  
  Do Not Block Weep holes

**EXPANSION**

- **95C NEUTRAL CURE SILICONE**
  Expansion Joints.
  
  Bond Breaker Tape CAT.NO. 827T
  
  Seal Tape Edges CAT. NO. 95C
  
  Seal Gap CAT.NO. 95C
  
  Seal Screw Heads in Slotted (Expansion) Holes. CAT.NO. 95C
  
  Fill with Sealant to Create a Water Shed. CAT.NO. 33S/RTV408
  
  Do Not Block Weep holes

**STRUCTURAL**

- **ALL STRUCTURAL SEALANTS REQUIRE TESTING AND APPROVAL.**
  
  Glass to Glass or Glass to Metal
